Ultra-Low Capacitance 1:2 VGA Switch with $\pm 15\text{kV}$ ESD

MAX4885E

General Description

The MAX4885E integrates high-bandwidth analog switches and level-translating buffers to implement a complete 1:2 multiplexer for VGA signals. The device provides switching for RGB, display data channel (DDC). Horizontal and vertical synchronization (HSYNC/VSYN) inputs feature level-shifting buffers to support low-voltage CMOS or standard TTL-compatible graphics controllers, meeting the VESA requirement of $\pm 8\text{mA}$. DDC, consisting of SDA_L and SCL_L, is a bidirectional active-level translating switch that reduces capacitive load. The MAX4885E features high ESD protection to $\pm 15\text{kV}$ Human Body Model (HBM) on all twelve externally routed terminals. See the *Pin Description* section. All other pins are protected to $\pm 10\text{kV}$ Human Body Model (HBM).

The MAX4885E is specified over the extended -40°C to $+85^{\circ}\text{C}$ temperature range, and is available in the 24-pin, 4mm x 4mm TQFN package.

Applications

Notebook Computers/Docking Stations
Digital Projectors
Computer Monitors
Servers/Storage
KVM Switches

Pin Configuration

Features

- ◆ $\pm 15\text{kV}$ HBM ESD Protection on Externally Routed Terminals
- ◆ 1GHz Bandwidth
- ◆ Low 5Ω (typ) On-Resistance (R, G, B Signals)
- ◆ Low 6pF (typ) On-Capacitance (R, G, B Signals)
- ◆ Low R, G, B Skew -50ps (typ)
- ◆ Near Zero Power Consumption ($< 2\mu\text{A}$)
- ◆ Ultra-Small, 24-Pin (4mm x 4mm) TQFN Package

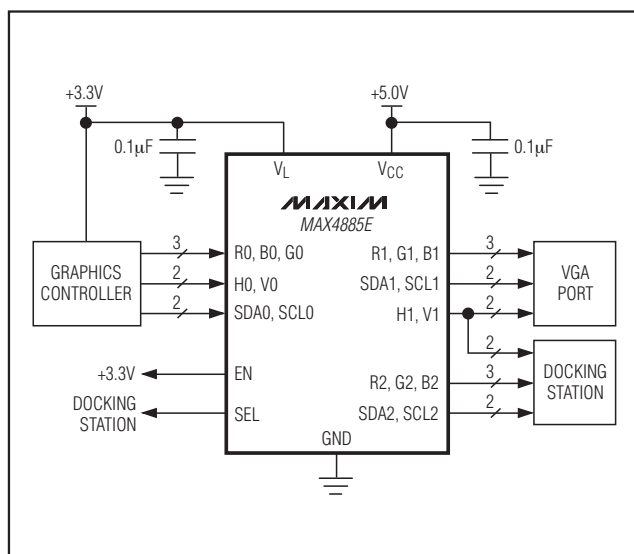

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE

Typical Operating Circuit

Ultra-Low Capacitance 1:2 VGA Switch with $\pm 15\text{kV}$ ESD

ABSOLUTE MAXIMUM RATINGS

(All voltages referenced to GND.)

V_{CC} , V_L	-0.3V to +6V
R_{-} , G_{-} , B_{-} , SDA1, SCL1, SDA2, SCL2, H1, V1, (Note 1)	-0.3V to $V_{CC} + 0.3\text{V}$
H0, V0, SDA0, SCL0, EN, SEL	-0.3V to $V_L + 0.3\text{V}$
Continuous Current through RGB Switches	$\pm 30\text{mA}$
Continuous Current through DDC Switches	$\pm 30\text{mA}$
Peak Current through RGB Switches (pulsed at 1ms, 10% duty cycle)	$\pm 90\text{mA}$
Peak Current through DDC Switches (pulsed at 1ms, 10% duty cycle)	$\pm 90\text{mA}$

Continuous Power Dissipation ($T_A = +70^\circ\text{C}$)

24-Pin TQFN (derate 27.8mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$)	2222mW
Junction to Ambient Thermal Resistance (θ_{JA}) (Note 2) 24-Pin TQFN	36°C/W
Junction to Ambient Thermal Resistance (θ_{JC}) (Note 2) 24-Pin TQFN	3°C/W
Operating Temperature Range	-40°C to $+85^\circ\text{C}$
Storage Temperature Range	-65°C to $+150^\circ\text{C}$
Junction Temperature	$+150^\circ\text{C}$
Lead Temperature (soldering, 10s)	$+300^\circ\text{C}$

Note 1: Signals exceeding V_{CC} or GND are clamped by internal diodes. Limit forward-diode current to maximum current rating.

Note 2: Package thermal resistances were obtained using the method described in JEDEC specifications. For detailed information on package thermal considerations, refer to www.maxim-ic.com/thermal-tutorial.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

($V_{CC} = +5.0\text{V} \pm 10\%$, $V_L = +2\text{V}$ to $+5.5\text{V}$, $T_A = T_{MIN}$ to T_{MAX} , unless otherwise noted. Typical values are at $V_{CC} = +5.0\text{V}$, $V_L = +3.3\text{V}$ and $T_A = +25^\circ\text{C}$.) (Note 3)

Detailed Description

The MAX4885E integrates high-bandwidth analog switches and level-translating buffers to implement a complete 1:2 multiplexer for VGA signals. The device provides switching for RGB, HSYNC, VSYNC, SDA_ and SCL_ signals.

The HSYNC and VSYNC inputs feature level-shifting buffers to support TTL output logic levels from low-voltage graphics controllers. These buffered switches may be driven from as little as +2.0V up to +5.5V. RGB signals are routed with the same high-performance analog switches, and SDA_, SCL_ signals are voltage clamped to a diode drop less than V_L. Voltage clamping provides protection and compatibility with SDA_ and SCL_ signals and low-voltage ASICs. In keyboard/video/

mouse (KVM) applications, V_L is normally set to +5V because low-voltage clamping is not required, as specified by the VESA standard.

Drive EN logic-low to shut down the MAX4885E. In shut-down mode, all switches are high impedance, providing high-signal rejection. The RGB, HSYNC, VSYNC, SDA_, and SCL_ outputs are ESD protected to $\pm 15\text{kV}$ by the Human Body Model.

RGB Switches

The MAX4885E provides three SPDT high-bandwidth switches to route standard VGA R, G, and B signals (see Table 1). The R, G, and B analog switches are identical, and any of the three switches can be used to route red, green, or blue video signals.

1	1	SDA0 to SDA2 SCL0 to SCL2
0	X	SDA ₊ , SCL ₊ , high impedance

X = Don't care.

Horizontal/Vertical Sync Level Shifter

HSYNC/VSYNC are buffered to provide level shifting and drive capability to meet the VESA specification.

Display-Data Channel Multiplexer

The MAX4885E provides two voltage-clamped switches to route DDC signals (see Table 3). Each switch clamps signals to a diode drop less than the voltage applied on V_L. Supply +3.3V on V_L to provide voltage clamping for VESA I²C-compatible signals. If voltage clamping is not required, connect V_L to V_{CC}. The SDA₊ and SCL₊ switches are identical, and each switch can be used to route either SDA₊ and SCL₊ signals.

ESD Protection

As with all Maxim devices, ESD-protection structures are incorporated on all pins to protect against electrostatic discharges encountered during handling and assembly. Additionally, the MAX4885E is protected to $\pm 15\text{kV}$ on RGB, HSYNC, VSYNC, SDA₊ and SCL₊

outputs by the Human Body Model (HBM). See the *Pin Description* section. For optimum ESD performance, bypass each V_{CC} pin to ground with a 0.1 μF or larger ceramic capacitor.

Human Body Model (HBM)

Several ESD testing standards exist for measuring the robustness of ESD structures. The ESD protection of the MAX4885E is characterized with the Human Body Model. Figure 3 shows the model used to simulate an ESD event resulting from contact with the human body. The model consists of a 100pF storage capacitor that is charged to a high voltage, then discharged through a 1.5k Ω resistor. Figure 4 shows the current waveform when the storage capacitor is discharged into a low impedance.

ESD Test Conditions

ESD performance depends on a variety of conditions. Please contact Maxim for a reliability report documenting test setup, methodology, and results.

Applications Information

The MAX4885E provides the level shifting necessary to drive two standard VGA ports from a graphics controller as low as +2.2V. Internal buffers drive the HSYNC and VSYNC signals to VGA standard TTL levels. The DDC multiplexer provides level shifting by clamping signals to a diode drop less than V_L (see the *Typical Operating Circuit*). Connect V_L to +3.3V for normal operation, or to V_{CC} to disable voltage clamping for DDC signals.

Power-Supply Decoupling

Bypass each V_{CC} pin and V_L to ground with a 0.1 μF or larger ceramic capacitor as close as possible to the device.

PCB Layout

High-speed switches such as the MAX4885E require proper PCB layout for optimum performance. Ensure that impedance-controlled PCB traces for high-speed signals are matched in length and as short as possible. Connect the exposed pad to a solid ground plane.
